How to add content to this blog

How to add new content.

1. Write a `.md` file in the `_posts` directory, with name `YYYY-MM-DD-topic.md`, where YYYY is the year, etc. Separate words in the topic part using hyphens. Use \"' triple-backtic-R notation for R code, and similar for other languages.
2. If this `.md` file contains code that is to produce results that will go in the blog, isolate this code and run it. If the output is textual, include it in the `.md` file. If it is a figure, put it in `../docs/assets/images` with a name that is based on the name of the `.md` file, and then insert appropriate links in the `.md` file. (See the box-model item, as an example.)
3. Go one level up, and then use `git add`, then `git commit` and finally `git push` to update the content on the server.
4. Wait 5 minutes or so, and then check the webpage to see if the update worked, and if you like the look of the content.
